

Pei Long Liu

Objective: Product Manager Intern (AI Product / Tool Product) | Shang Hai | 随时到岗
19岁 | 男 | 汉族
15225585490 | l15225585490@163.com

Skills

Product Design Requirement Analysis | Competitive Research | User Journey Design | Information Architecture | PRD | MVP Design | Version Planning
AI-Native Workflow Claude Code | Codex | Cursor | AI-assisted Prototyping | Development Briefs | Requirement Breakdown | Experience Acceptance
Prototyping & Implementation Figma | Axure | React | Vite | HTML/CSS/JavaScript
Domain Exposure Tool Products | Creator Tools | Game Tool Products | Basic Understanding of Internationalization and Localization

INTERNSHIP EXPERIENCE

3DMGAME - Leading Domestic Single-player Game Portal | Product Manager Intern 2025-12 ~ 2026-05
Participated in the optimization of the desktop-side store page for the FLiNG-related product line, focusing on low first-time purchase rate, organic purchase rate, and returning-user purchase rate. Identified that returning users showed stronger conversion due to existing trust in the FLiNG brand and its founder IP, while new users lacked clear value perception and purchase motivation.
Conducted competitive research on game tools, membership systems, and tool-based store products. Analyzed information architecture, membership benefit presentation, paid entry points, product ranking logic, and conversion paths.
Proposed an app-level information architecture optimization plan and a store page redesign plan. Produced prototypes with Axure, Figma, and MockingBot.
Redesigned the store page around “lowering understanding cost, strengthening payment reasons, and improving visual impact,” with emphasis on membership benefits, product/service ranking, core entry exposure, and first-screen visual hierarchy. Maintained the optimization requirement pool and divided requirements into information architecture, membership benefits, store ranking, visual hierarchy, and localization preparation. Designed a two-stage iteration plan based on conversion impact, development cost, and release rhythm.
Wrote PRDs and page redesign documents for UI/UX and development teams. **Presented competitive research, redesign demos, and iteration plans in team meetings. The proposal was recognized by supervisors and the CEO and entered the follow-up iteration roadmap.**
After implementation, store conversion improved within one month: returning-user repurchase rate increased by **1.7%**, organic purchase rate increased by **4.9%**, and first-time registered purchase rate increased by **13%**.

Haohan Tonghui Intelligent Technology Co., Ltd. - AI Product Manager Intern 2025-06 ~ 2025-11
Participated in an early-stage AI companion toy project for smart cockpit scenarios, aiming to transfer emotional companionship from desktop AI devices to in-car environments.
Analyzed 13 desktop companion robots and AI toy products, covering sensor response, VUI interaction, physical motion feedback, emotional expression, and human-machine interaction rhythm. Organized 200+ interaction cases for product testing and functional discussions.
Assisted in mapping basic interaction flows for driving emotion relief, child companionship, and in-car conversation scenarios, including trigger condition, AI perception, voice feedback, physical action, and user confirmation.
Built foundational understanding of AI hardware products, multimodal interaction, embodied interaction, and emotional companionship products in smart cockpit scenarios.

Project Experience

Pianke — AI-Native Creator Image Processing Tool - Profile <https://cocacolin123.github.io/work-collection/>

2026-03 ~ 至今

Independent Product Project | WeChat Mini Program Launched

Identified that ordinary users do not lack photo-taking or editing tools, but lack a lightweight creation path to quickly turn photos into cards, posters, diary images, and shareable visual content. The insight came from student interviews, questionnaires, and social media content observation.

Repositioned the product from an early photography portfolio / personal website tool to an AI-assisted image template editor, focusing on fast generation of shareable visual outputs.

Designed the core workflow of “upload image — choose template — edit text/style — preview in real time — export and share.” Abstracted reusable editing capabilities including image upload, text editing, style configuration, template preview, and export.

Supported multiple template types such as moment cards, posters, creative borders, and Paper Mount through a configurable template system.

Built an AI-Native development workflow as a solo creator: using PRD, development briefs, component boundaries, acceptance criteria, handoff documents, and Git repository management to guide Claude Code, Codex, and Cursor in front-end prototyping, component implementation, interaction adjustment, and version iteration.

Under constraints of no backend, solo development, and WeChat Mini Program limits, actively reduced MVP scope by postponing account systems, complex asset libraries, and high-freedom canvas editing, prioritizing template quality, clear editing paths, and export experience.

Education

Shanghai Institute of Technology - Bachelor’ s Degree in Labor and Social Security - 本科

2024-09 ~ 至今

GPA: 4.3/5, Top 5% in major

2024 University-level Academic Scholarship

CET-4 passed; strong spoken English and fluent reading ability for English technical documents

Summary

2028 undergraduate student seeking Product Manager / AI Product / Tool Product internship opportunities. Available immediately and able to commit to a long-term, stable internship. **Experienced in both real product team collaboration and independent product projects.** Previously worked on the FLiNG-related product line at a leading single-player gaming portal in China, focusing on low first-time purchase rate, organic purchase rate, and returning-user purchase rate in the store module. Conducted competitive research, optimized information architecture, redesigned membership benefit presentation and store pages, and proposed a two-stage iteration plan. The proposal was recognized by supervisors and the CEO, and conversion metrics improved after implementation.

Independently led “Pianke,” an AI-assisted image template and lightweight editing tool. Based on user interviews and social media sharing scenarios, defined the product direction as “high-quality visual templates + lightweight editing + fast export.” Used Claude Code, Codex, Cursor and other AI Coding tools to complete requirement breakdown, development briefs, front-end prototyping, visual review, and iterative fixes.

Familiar with requirement analysis, competitive research, PRD writing, information architecture, user journey design, and MVP scoping. Interested in AI-Native tool products, creator tools, game tool products, and internationalization / localization for overseas markets.
